

Our standard pattern of somersault harness is made by AMSPEC in California. They are available in various sizes and come in black or white as standard.

Ballistic fabric side panels add support around the adjustable metal pick points and lacing front and back means that a really tight and secure fit is possible.

For routines and flying sequences that involve a lot of somersaulting or precise and smooth rotational positioning this is the ideal harness to use and the choice of many professional aerialists.

Although not always entirely necessary, detachable shoulder straps are available for this type of harness and we would always recommend using them unless there is a **very** good reason not to.

1898 quick release

1998 quick release

Shackle fitting

We took an original Kirby quick release clip to AMSPEC and they re-designed it to fit their swivel plates. For film and video etc. where there is more time for attaching and detaching the flying wires, the smaller shackle type fitting can be used.
